

General

Curio's general preferences

Appearance

If running on macOS Mojave or newer, Curio's window chrome, toolbar, inspectors, shelf, Organizer and other interface elements will now change dynamically based on the Mojave's dark mode setting in System Preferences > General. You can however, override the system setting here within Curio's Preferences and force a light or dark appearance.

It's important to note that the idea space content will still abide by the specified coloring and styles set for your idea spaces and figures. Those styles won't invert or change on-the-fly based on the dark mode setting

Default Projects Folder

Specify a default folder used when saving Curio projects. The default is ~/Documents/Curio.

Mac App Store Notice

Sandboxed Curio is unable to set a default projects folder so you must specify it manually by clicking the *Choose* button. Note that Curio will have access to all files in the folder you choose.

If you have Curio Professional, then certain advanced feature like external asset libraries and project lock files are only supported in this default projects folder because Curio needs full access to the files in the folder to support these features.
