

Search - RegEx

Use regular expressions when searching!

Regular Expression Support

For Curio Professional users, the Search shelf text field now supports regular expressions.

Internally Curio uses the Mac's built-in NSRegularExpression class for searching so it uses that syntax. For more information see [this tutorial](#) and [Apple's guide](#).

Here are some examples:

curio	A normal search; matches figures with 'curio' anywhere even if within another word, like 'zengobicurio' or 'curiosity'.
^curio	Matches figures only if 'curio' is the first word.
\bcurio	Matches figures only if 'curio' begins a word thus matches 'curiosity' but not 'zengobicurio'.
zengobilcurio	Matches figures with either 'zengobi' or 'curio' anywhere, even if within another word.
\bzengobi\b\bcurio\b	Matches figures with either 'zengobi' or 'curio' as whole words.
zengobi.*curiolcurio.*zengobi	Matches figures with both 'zengobi' and 'curio' anywhere, even if within another word.
\bzengobi\b.*\bcurio\b\bcurio\b.*\bzengobi\b	Matches figures with both 'zengobi' and 'curio' as whole words.
