

Part 2: Working with Figures

Files

Any type of file can be dragged into Curio where they can be displayed either as simple figures with icon and title, or as preview image figures where a Quick Look preview of the file is displayed.

From the Finder

When dragging in a file from the Finder, a *copy* of the file will be embedded in your project. Alternatively, if you hold the Command key while dragging in a file then the original will be *moved* into your project. If you hold the Option key then an *alias* to the original will be created.

Some files, such as csv, opml, and mmap files, can be converted directly into tables, lists, or mind maps.

From the Web

Drag in selected text and/or images directly to your idea space. Curio will automatically include an attribution line to any dragged-in text so you can jump to the source; right-click on images to jump to their source URL as well.

From Mail

Mail messages can be dragged into Curio where a copy of the message itself will be embedded into your project. Double-clicking it will render the message, and decode any message attachments, in your default mail application.

From Contacts and Calendar

Contacts and calendar entries can be dragged into Curio as well so you can track all resources associated with your project.
