

Part 2: Working with Figures

PDFViews

Selecting a PDF figure, or a PDF stored directly in the Organizer, will reveal a new PDF page navigation and annotations bar in the inspector bar area. Using these controls you can step backwards or forwards through the PDF or enter a specific page to view.

Annotations

To make annotations to the PDF, click the Start Annotating button in the inspector bar or hold Option and double-click the figure. Then select text in the PDF and click the new highlight, strikethrough, and underline buttons. These annotations are stored within the PDF document itself and visible in other apps such as Preview. When done, click the Stop Annotating button or press Escape.

Quick Look and Opening

Like other asset figures, you can press spacebar to view a Quick Look of the PDF figure, or double-click to launch it into Preview.

Zengobi Announces Curio 1.0

Creativity Shines with Innovative New Software

RALEIGH, NC — February 17, 2004 — Zengobi, Inc. announced today the release of Curio, an innovative new product for creative thinkers and design professionals on Mac OS X. This release of Curio is available for immediate download at www.zengobi.com.

Curio is a flexible, open environment that helps users generate, communicate, and organize their best ideas. Curio guides users through the challenging Concept Discovery phase of creative design — the lengthy period of research and exploration where the user develops the core concept behind their creative solution.

Curio encourages users to be more creative, productive, and efficient in several important ways:

- **Curio encourages background research with project dossiers.** Curio's dossier feature allows the user to fill in important background information vital to the project. For designers, a customizable creative brief dossier template is included that facilitates client/designer relationships by defining the goals and objectives of the project. This keeps both parties focused and eliminates guesswork and misunderstandings.
- **Curio helps users brainstorm with an amazingly flexible sketchbook.** A Curio project can contain an unlimited number of idea spaces where users can take notes, sketch with pressure-sensitive pens, grab text, URLs, and images from the web, and place external files including images, movies, music, and QuickTime VR files anywhere on the page. Curio allows the user to create a flexible collage of ideas and doesn't enforce a rigid outline format.
- **Curio provides tools to break through creative roadblocks with Sleuth.** This incredibly handy agent offers the results from a slew of web sites that appeal specifically to creative thinkers and designers such as stock photo agencies, font foundries, sound and movie archives, encyclopedia listings, translations, rhyming dictionaries and more. Sleuth streamlines brainstorming by delivering directly into the Curio environment which speeds up the idea generation process while offering fresh ideas and new
